

Project Design Phase
Problem – Solution Fit Template

Date	15 February 2025
Team ID	SWTID-2026-4968
Project Name	Script - controlled ACL - Restrict Record Access Based On Field Value
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioral patterns and recognize what would work and why

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
- **Understand the existing situation in order to improve it for your target group.**

Template:

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS ServiceNow administrators, security/compliance officers and process owners (ITSM, HR, Finance) of organizations that store sensitive records on the ServiceNow platform and must control who can view or modify them based on the data in each record.	6. CUSTOMER CONSTRAINTS CC Limited scripting knowledge; access changes must not break existing users or slow down list/report performance; least-privilege and audit/compliance rules must be followed; no budget for extra tables or instances; changes must move safely through update sets and testing.	5. AVAILABLE SOLUTIONS AS Role-based ACLs only: simple, but too coarse for record-level rules. UI policies / client scripts: easy, but can be bypassed (not server-side). Query business rules: powerful, but hard to maintain and audit. Separate tables / manual sharing: secure, but costly and creates duplicate data.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Restrict read/write access to a record depending on a field value (e.g. confidential flag, department, priority, state). Make sure only the right roles/groups see sensitive records. Enforce the rule on the server side without creating many extra roles or tables.	9. PROBLEM ROOT CAUSE RC Sensitive and normal records live in the same table, and role-based ACLs cannot evaluate record data. Access needs change with field values, and client-side controls are bypassable, so users can see records they should not, creating audit and compliance risk.	7. BEHAVIOUR BE Admins create many roles or groups for each case, hide fields with UI policies, or copy sensitive data into separate tables. Indirectly related: users share records by export/email, and admins test access by impersonating users and checking ACL results.	
Focus on J&P, tap into BE, understand RC	3. TRIGGERS TR An audit finding or data-exposure incident; a new compliance requirement (GDPR, SOX, HIPAA); noticing confidential records visible to unauthorized users in lists and reports; onboarding a new department.	10. YOUR SOLUTION SL Script-controlled ACL: create an ACL on the table/field with an advanced script that checks the record's field value (e.g. <code>current.confidential</code>) together with the user's roles or groups (<code>gs.hasRole()</code>, <code>isMemberOf()</code>) and sets answer to true or false. Access is granted only when the condition is met, so restricted records stay hidden from unauthorized users. It is enforced on the server, needs no extra tables, is easy to test by impersonation and moves through update sets.	8.1 ONLINE CH Admins look up ACL scripting help in ServiceNow Docs, Community forums, Now Learning and video tutorials; they verify rules in Security > Access Control (ACL) and by impersonating users. Use these online channels to reach and guide them.	Focus on J&P, tap into BE, understand RC
	4. EMOTIONS: BEFORE / AFTER EM Before: anxious, exposed, unsure who can see sensitive data, frustrated with role sprawl. After: confident, in control, compliant and trusting the platform.		8.2 OFFLINE CH Security and audit review meetings, compliance workshops, internal training sessions and discussions with process owners and the information security team. Use these for customer development.	
Identify strong TR & EM	Extract online & offline CH of BE
