

Full Stack Development with MERN

Project Documentation format

1. Introduction

- Project Title: Script - controlled ACL - Restrict Record Access Based On Field Value
- Team ID: SWTID-2026-4968

2. Project Overview

- Purpose: Describe the purpose of the script-controlled ACL and how it restricts record access based on a field value.
- Features: Field-based record access control, scripted authorization logic, and controlled access to records.

3. Architecture

- Application: Describe the ServiceNow application and the table/records protected by the ACL.
- ACL: Define the script-controlled access control rule and the field-value condition used to permit or restrict access.
- Data: Describe the relevant table field and record data used by the ACL script.

4. Setup Instructions

- Prerequisites: ServiceNow instance access, appropriate administrative/developer role, and the target table and field.
- Configuration: Create or open the required ACL, configure the operation and table, and add the script that evaluates the field value.

5. Folder Structure

- ACL Configuration: Describe the location and configuration of the access control rule.
- Script Logic: Explain the organization of the field-value validation and access decision logic.

6. Running the Application

- Open the target records in the ServiceNow instance and test access according to the configured field value.
- o Authorized condition: The ACL allows access when the configured field condition is satisfied.
- Restricted condition: The ACL prevents access when the field condition is not satisfied.

7. API Documentation

- Document any ServiceNow APIs or server-side methods used by the ACL script.
- Include relevant methods, parameters, field values, and expected access behavior.

8. Authentication

- Explain how ServiceNow authentication and authorization work with the ACL.
- Include details about roles, ACL evaluation, and the scripted condition used to control record access.

9. User Interface

- Provide screenshots showcasing the ACL configuration,

relevant field values, and the resulting record access behavior.

10. Testing

- Describe the testing strategy for authorized and restricted field values.
- Verify that users can access records only when the ACL script condition is satisfied.

11. Screenshots or Demo

- Provide screenshots or a link to a demo showing the ACL configuration, field values, and access results.

12. Known Issues

- Document any known configuration, permission, field-value, or ACL evaluation issues that users or developers should be aware of.

13. Future Enhancements

- Outline potential improvements such as supporting multiple field conditions, reusable script logic, enhanced logging, and more granular record-access controls.

- Provide screenshots or a link to a demo to showcase the application.

12. Known Issues

- Document any known bugs or issues that users or developers should be aware of.

13. Future Enhancements

- Outline potential future features or improvements that could be made to the project.
